# Phosphorus status in the soils of Western European countries in 1991

(Steén, 1997)

# Phosphorus supplies of soils in Central and Eastern European countries in the early 1990s (Csathó et al., 2006)

# Phosphorus fertiliser recommendation for fields in Germany based on soil fertility class (STP) (Vetter and Fruchtenicht (1974))

Fertility Class	Fertiliser Ratio	
E: Very high	0	
D: High	0.5	
C: Moderate	1.0	C= Maintenance
B: Low	1.5	
A: Very low	2.0	

The diagram shows a table with three columns: 'Fertility Class', 'Fertiliser Ratio', and an empty column. The rows are labeled E: Very high, D: High, C: Moderate, B: Low, and A: Very low. The corresponding fertiliser ratios are 0, 0.5, 1.0, 1.5, and 2.0. A box labeled 'C= Maintenance' is positioned to the right of the 'C: Moderate' row. Arrows point from the 'Fertiliser Ratio' column to the 'C= Maintenance' box for the rows D: High, C: Moderate, B: Low, and A: Very low.

# Correlation between P supply and P balances of the EU countries in 1991

1 - Austria	7 - Greece	14 - Sweden	20 - Latvia	27 - Norway
2 - Belgium and Lux.	8 - Ireland	15 - UK	21 - Lithuania	28 - Romania

# Estimated cumulative N balance of European countries, 1991–2005 (N kg/ha agricultural land)

# Nitrate pollution of ground water in the EU

(Hamell, 2007)

**EU countries should reduce the recommended mineral fertiliser N rates by the quantity of N applied in the form of farmyard manure/slurry, expressed in fertiliser N equivalency, and taking into account the rate at which farmyard manure is utilised by the crop, within the 3–4-year period. The fertiliser N equivalency of FYM or slurry nitrogen can be considered as 50% on average, varying according to the livestock species and the technology.**

On nitrate-sensitive areas, while retaining the maximum permitted application of 170 kg N/ha of organic origin, the rate at which **farmyard manure** is utilised by the crops should also be considered in the directive, calculating

*on sandy or sandy loam soils:*

with 50% in the 1<sup>st</sup> year, 30% in the 2<sup>nd</sup> and 20% in the 3<sup>rd</sup>

*on loam, clay loam and clay soils:*

with 40% in the 1<sup>st</sup> year, 30% in the 2<sup>nd</sup>, 20% in the 3<sup>rd</sup> and 10% in the 4<sup>th</sup>

*For slurry N*, the rate of utilisation should be calculated as 75% in the 1<sup>st</sup> year and 25% in the 2<sup>nd</sup> year

**If organic manure or slurry is applied every year, the total quantity of organic manure/slurry that will exert its effect in the given year should not exceed the 170 kg N/ha limit on nitrate-sensitive areas. There should be no derogation given to any country on the 170 kg N/ha/year limit because of the parallel problem of excess phosphorus.**

**Only fertiliser recommendation systems that have been tested under field conditions for a number of years and that meet strict environment protection and economic criteria should be authorised for use in practice.**

**In most cases, the application of a total nitrogen quantity equivalent to more than 200 kg N/ha mineral fertiliser (applied as farmyard manure/slurry + mineral fertiliser) cannot be justified from the agronomic point of view and should be officially banned in the interests of environment protection.**

**Within EU, on soils  
excessively supplied with P,  
either organic, or mineral P  
application should be  
prohibited/forbidden**

# Conclusion #1

In many areas, more developed in EU, manure surpluses cause environmental threat. In other, less developed areas of EU, nutrient mining causes agronomic and economic problems. In context with both problems, there should be a trend in EU toward optimal livestock density, adjusted to the milk production, egg and meat needs of the population, either in the areas with too high and too low livestock density  
**(Sims et al., 2005).**

## **Conclusion #2**

Derogation should be given to the Central and Eastern European EU countries to prolong prohibiting foreigners to purchase field or other agricultural properties until the necessary livestock number changes between the Western and Eastern region of EU is finished.

The benefit from all the changes should go to the local communities.

**Thank you for your attention!**
